

PhD research topic proposal
BME, Doctoral School of Mathematics and Computer Science

Name of supervisor :

Máté Matolcsi

Degree:

DSc

Title of the topic:

Selected applications of Fourier analysis

Short description:

The Delsarte LP-bound has been applied with success in various branches of mathematics, most notably in the density problem of sphere packings in dimensions 8 and 24 in recent years.

During the PhD course we will learn the Fourier-analytic formulation of the method, review some of the well-known applications, and try to achieve new results in some selected problems related to it. In particular, possible areas of research include: density of packings and distance-avoiding sets, the problem of mutually unbiased bases (MUBs), and properties of spectral sets and tiles.

Requirements:

Adequate command of English language, basic knowledge of Fourier analysis, good skills in problem solving skills
